

— COLLAB DESKTOP · RELEASE NOTES

Apollo A3

July 28, 2026

The Collab Desktop App is a desktop UI for chat interactions, providing connectivity to locally-run and hub-deployed models, as well as access to the capability marketplace. It's a unified launcher and interface for working with a range of AI models.

A3 is a major step forward for Frames, Connectors, and Agents. Frames now have a live on-chat panel, groups, rich metadata, sharing and permissions, and full change history; new connectors bring your Google Drive, Slack, Gmail, and Calendar into chat; and Agents let you create, configure, and run purpose-built assistants tied to your Frames, tools, and models.

— HIGHLIGHTS

Frames on Chat

Activate and deactivate Frames from a panel in the chat window, see which Frames applied in your history, group them, and inject context dynamically.

Metadata, Sharing & History

Add descriptions and visibility, publish Frames, share with multiple owners and ACLs, and review a full change history.

Connectors

Bring outside context into chat with Google Drive, Slack, Gmail, and Calendar connectors — plus voice integration for hands-free input.

Agents

Create and configure Agents tied to Frames, tools, and models. Run parallel agents, assign per-agent skills, and hand off CoWork-style Tasks.

Usage Metrics Dashboard

See auths, chats, Frames uploaded, and active Frames at a glance.

WHAT'S NEW

Setup Guides

Getting started with the Docker-based setup — required to run Agents.

WATCH

Docker setup – Windows

WATCH

Docker setup – macOS

Frames

A live on-chat panel, groups, rich metadata, sharing, and change history.

FRAMES ON CHAT

- **Frame panel on chat** — activate and deactivate Frames without leaving the conversation.
- **Frames in chat history** — the list of Frames applied to a chat is stored and visible in your history.
- **Dynamic Frame Injection** — Frame context is injected into the conversation dynamically as you chat.

WATCH

Frames — panel, chat history & dynamic injection

FRAME GROUPS

- **Frame Groups** — bundle one or more Frames into a Group with its own owners and visibility. A Group becomes visible to others once all Frames within it are published.

WATCH

Frame Groups

FIELDS, SHARING, PERMISSIONS & HISTORY

- **Frame fields & visibility** — add a description, set visibility (private / internal / public), and mark Frames published. New Frames default to **private, owners only**.
- **Frame sharing & permissions** — Frames support multiple owners (any owner can edit, delete, manage the owner list, and manage the ACL). Add an ACL to restrict who can access a Frame.
- **Frame change history** — every add, edit, delete, and ownership change is recorded with user, time, and event, and can be reviewed per Frame.
- **Frame / chat history navigation** — move between Frames and chat history more easily.

WATCH

Frame fields, sharing, permissions & history

Connectors

Bring outside context into chat.

- **Google Drive connector** — connect with per-user OAuth (read-only), search and read your files, and power use cases like a daily digest / to-dos built from Drive content.
- **Slack, Gmail & Google Calendar connectors** — bring messages, mail, and calendar context into chat.
- **Voice integration** — speak your input with built-in voice-to-text.

WATCH

Connectors & Voice

Agents

Purpose-built assistants tied to your Frames, tools, and models. Requires the Docker-based setup — see the Setup Guides above.

- **Agents overview** — create and configure Agents, associating each with Frames, tools, and models.
- **Agent enhancements** — run parallel agents, assign per-agent skills, select a model per agent, keep per-agent chat history, and recover cleanly from Docker.
- **CoWork-style Task feature** — hand agents longer-running tasks in a CoWork-style workflow.
- **Usage metrics dashboard** — track auths, chats, Frames uploaded, and active Frames.

WATCH

Agents, Tasks & Metrics

Also in A3

- **Update-available notification & install** — Collab checks for new releases and prompts you to update.

SUPPORTED PLATFORMS

• macOS

• Windows

• Linux

- 1 Go here: openteams.com/collab
 - 2 Download and install the Collab release for your OS.
 - 3 Follow the **Setup Guides** videos above for the Docker-based setup on Windows or macOS.
-

Things to try

1. Activate Frames from chat

- Open the Frame panel in the chat window and toggle Frames on/off to control your active context.
- Start a new chat and check the history to confirm which Frames were applied.

2. Organize Frames into Groups

- Create a Group with one or more Frames, set its owners and visibility, and publish the Frames to make the Group visible to others.

3. Share and manage a Frame

- Open a Frame, set its description and visibility (private / internal / public), and publish it.
- Add additional owners and, if needed, an ACL to control access.
- Review the Frame's change history.

4. Connect an external source

- Connect Google Drive via Google sign-in (read-only), then ask a question that searches or reads your files — try a daily digest of recent documents.
- Try the Slack, Gmail, and Calendar connectors, and use voice input to dictate a prompt.

5. Create and run an Agent

- Create an Agent and associate it with Frames, tools, and a model.
- Assign per-agent skills, pick a model, and try running agents in parallel or handing off a CoWork-style Task.
- Open the usage metrics dashboard to see auths, chats, and active Frames.

— KNOWN ISSUES

- 1 Collab does not run local models on Windows machines without an NVIDIA GPU. [Issue #291](#)
- 2 When enabling multiple connectors in a chat, the **Connections** menu closes after each toggle, so it must be reopened to enable the next one — selections are still saved. [Issue #539](#)
- 3 On Windows, a longer Hub chat response may not render in the active chat view until Collab is closed and reopened — the response is saved and appears in History. [Issue #249](#)
